Each of them has a different learning curve, and all of them are different in their own right. Learning them requires time. Adobe Photoshop versus Other Photoshop Alternatives There are free or paid online and desktop alternatives to Photoshop. Efficiency, tolerance, and outcomes with dobutamine during cardiac catheterization. During cardiac catheterization, dobutamine was used to test the contractile status of the left ventricle. The effects of dobutamine on the catheterization laboratory staff and the patient were evaluated. The systemic administration of dobutamine is a standard part of the preprocedural evaluation of patients. However, its effect on the catheterization laboratory staff, with the exception of direct coronary perfusion, has not been evaluated. A prospective clinical study of 42 patients was conducted. The study included an initial bolus of dobutamine followed by a continuous infusion of dobutamine for the duration of the catheterization procedure. The patients were divided into 3 groups based on the proportion of their total exposure to dobutamine that was for left ventricular (LV) preload augmentation. Group A: LV preload-independent infusion (n = 17), Group B: LV preload-independent infusion with the use of angiographic additives (n = 9), and Group C: LV preload-dependent infusion (n = 16). Exposure to dobutamine was calculated by dividing the dose of dobutamine by the duration of the procedure (min). Continuous infusion of dobutamine did not affect the reporting staff, with respect to tachycardia, palpitations, dyspnea, and angina. The patients receiving dobutamine developed significant pressure gradients in 6 patients (33%) ($P = .01$), although the angiographic parameters were similar in all groups. There was no significant difference in procedure time among the

groups. Dobutamine, for optimal preload augmentation, is safe for use with a continuous infusion. It is associated with changes in the catheterization laboratory staff and hemodynamic changes in some patients. It is associated with a modest increase in postprocedure angiographic pressures.
